

Sprint #1 – Expected deliverables

This document outlines the requirements for the first sprint of the Software Engineering project. The following deliverables are expected:

- Since the order of the theoretical component has been adjusted, a CI pipeline is not required at this stage. Instead, teams must provide **mockups of the most relevant solution interfaces**.
- User stories, **including effort estimates**, must be created and **visible on the board**. Links to each team's board are provided in this document.
- The project repository must contain both the architecture and the project specification. A dedicated docs folder may be used for this purpose.
- A **plan for the next sprint** must be included in the boards, clearly identifying the user stories that will make up the MVP. Use labels to distinguish between what is expected in the current sprint and what is planned for the next one.
- Teams are expected to **begin the development of the MVP**, building on the planned user stories.
