

Sprint #5 – Expected deliverables

This document outlines the requirements for the fourth sprint of the Software Engineering project.

To optimize time, we'll start with individual questions, where each team member will have 1 minute to describe what they did this sprint.

The following deliverables are expected:

1. **Conversational Assistant** integrated into the application, designed to enhance user interaction and follow the latest conversational interface trends. The assistant should include:
 - A defined architecture and integration strategy within the existing system.
 - A documented design rationale (stored in docs/assistant.md).
 - A working prototype demonstrating basic conversation flow.
 - All Pull Requests related to this feature should be labelled as **“category:assistant”**.
2. **Extended Observability** to include frontend-level events and user actions, complementing existing backend metrics.
 - Logging of relevant user interactions (e.g., clicks, navigation, feature usage).
 - Metrics and traces from the frontend integrated with the observability platform.
 - Updated documentation in docs/observability.md, including new SLIs and SLOs reflecting frontend performance and reliability.
 - All Pull Requests related to this improvement should be labelled as **“category:observability”**.
