

Sprint #6 & 7 – Expected deliverables

We are almost at the end. The goal of Sprint 6 is to produce **complete, installation-ready documentation** that allows any new developer to understand, install, and run the system on a clean machine.

1. Project Report (main document)

The report must clearly include:

- The current system architecture (components, interactions, dependencies, critical flows).
- Defined personas relevant to the product.
- The core user stories that define the product's essential functionality.
- Onboarding instructions for new developers (requirements, environment setup, installation steps).
- Production configuration (environment variables, external services, build process, pipelines, infra notes).

2. Installation / Deployment Test

The documentation will be **validated by the teachers** by setting up the project on a clean server:

- Ubuntu Server **24.04.3 LTS**
- Intel **i7 CPU**

The group must ensure that the project can be installed and run **exactly as described**, with no undocumented steps.

Note: A *clean server* means a machine with **no Docker, no Git, no programming languages, no services, and no development tools pre-installed**. The documentation must assume a completely empty Ubuntu Server 24.04.3 LTS environment.

3. Pull Request Organization

All PRs related to this sprint must be labelled: **“category:documentation”**

At the end, when students finalize the document, it should also be submitted in e-learning.

4. Presentation (sprint 7)

The goal of Sprint 7 is to prepare the final academic defence of the project.

Presentation Requirements

- **15 minutes** presentation
- **+5 minutes** reserved for questions
- All team members must participate
